

THE LEAN STARTUP

How Today's Entrepreneurs use Continuous Innovation to Create Radically Successful Businesses

BY ERIC RIES

Huge amounts of money, time, passion, and skill are wasted each time an innovation or a startup fails. Yet, with the right processes - which can be learned - new products & services can be developed successfully.

The 5 Lean StartUp Principles

Startups face unique challenges and require special *entrepreneurial management*.

Entrepreneurs are everywhere.

Startup = A human institution designed to create new products/ services under great uncertainty. It can be a **new business**, or **part of a big organization**.

Entrepreneurship is Management

A startup must be managed, but in a way that suits its unique challenges. The Lean Startup method **combines lean thinking with continuous innovation**.

Build - Measure - Learn

Don't build your strategy and products/services on untested assumptions. Use the B-M-L feedback loop to **test assumptions, learn quickly and make constant adjustments**.

Validated Learning

Find out if customers want what you have to offer, before you build it. To make real progress from learning, **measure the results of each insight/ change applied**.

Innovation Accounting

Quantify if efforts are generating results: assess progress accurately and objectively in 3 steps: **Establish Baseline => Tune Engine => Pivot or Persevere** (and repeat)

Building your Lean Startup
